PROFILE

Experienced Backend Engineer with foundations in Java, DSA, and Node.js backend development. Experienced in building REST APIs, implementing authentication systems, and deploying applications using Docker and CI/CD pipelines.

EDUCATION

Vivekanand College for Advanced Computer & Information Science
Bachelor of Computer Application

Surat, GJ
2023- 2026

SKILLS

Programming Languages: Java, Javascript, Typescript

Problem Solving: Data Structures & Algorithms (Java)

Backend Development: Node.js, Express.js, REST APIs, Socket.IO, JWT Authentication, RBAC, Distributed Systems

Frontend(Basic): React.js, Next.js

Database: MongoDB, PostgreSQL, Redis

Architecture & Scalability: Distributed Locking, Connection pooling, Caching, Background Jobs

DevOps & Deployment: Docker, CI/CD (GitHub Actions), Nginx, Prometheus, OpenTelemetry, Render, Railway

Tools: Git, GitHub, Postman, Electron

EXPERIENCE

Malavia Hospital- IT department

Surat, GJ

Backend Engineer

April 2024 – Present

- Led backend development of a full-stack, multi-platform (Web + Desktop) Healthcare Insurance Claim Management System using TypeScript, Node.js, Express, and MongoDB, featuring a finite state machine governing 15+ claim statuses with business-rule guards across cashless and reimbursement workflows.
- Engineered WebSocket-based pessimistic concurrency control to prevent simultaneous claim editing across LAN clients, with device-level lock tracking and automatic release on disconnect.
- Implemented full observability stack with Prometheus (5 custom instruments), Jaeger distributed tracing via OpenTelemetry, and Pino structured logging with request ID correlation.
- Deployed via Docker Compose with multi-stage builds, PM2 cluster mode, and Nginx reverse proxy with WebSocket upgrade support.
- Architected the system to sustain 500K+ claims, 1,000+ concurrent users, 5M+ notifications, and 20M+ API requests/day via PM2 clustering, MongoDB indexing, connection pooling, and response compression.
- Built a financial settlement engine computing hybrid discounts with department-level breakdowns, vendor/hospital payout splits, TDS deductions, and payer contract policy application.
- Hardened API security with Helmet, NoSQL injection sanitization, rate limiting, Zod validation, HTTPS/TLS, CORS whitelisting, and dual JWT rotation with bcrypt-hashed refresh tokens.

PROJECTS

SaaS Backend

03/2026 - present

- Built a multi-tenant SaaS backend using TypeScript and Node.js with scalable REST APIs.
- Implemented retry logic, error handling, and logging for reliable, fault-tolerant performance.

HMS Backend

11/2025 – 03/2026

- Developed a Hospital Management System backend with RBAC, billing, and secure authentication using Node.js and MongoDB.
- Integrated Razorpay payment gateway and deployed the backend using Docker with automated CI/CD pipelines.
