PROFILE

TypeScript Fullstack Developer with 2+ years of experience designing, building, and operating secure, production-grade web applications end-to-end — from frontend UI through Node.js/Express REST APIs to deployment and monitoring. Comfortable owning the full software development lifecycle: architecture planning, implementation against defined technical specifications, build/deployment support, and 3rd-level troubleshooting of live systems. Experienced working within component-driven UI development (React/Next.js) and collaborating closely with QA, DevOps, and business stakeholders on functional and technical design decisions.

SKILLS

Languages: TypeScript, JavaScript, Java

Frontend: React.js, Next.js, HTML5, CSS3, component-based UI architecture

Backend: Node.js, Express.js, REST API design, Socket.IO, JWT Authentication, RBAC

Database: MongoDB, PostgreSQL, Redis

Cloud, Build & Deployment: AWS EC2, S3, IAM, Nginx, PM2, Docker, GitHub Actions (CI/CD), Render, Railway

Observability & Ops: Prometheus, OpenTelemetry, Pino (structured logging), production monitoring & 3rd-level support

Testing & Quality: Manual & automated testing collaboration, error handling, fault-tolerant retry logic

Tools: Git, GitHub, Postman, Electron

Problem Solving: Data Structures & Algorithms (Java)

EXPERIENCE

Full Stack Engineer — Malavia Hospital, Surat, GJ

April 2024 – Present

- Owned the complete software development lifecycle — planning, design, implementation, deployment, and maintenance — of a production healthcare insurance claims platform used daily by hospital staff.
- Built a centralized web application (React, TypeScript, Node.js, Express, MongoDB) replacing manual claim processing workflows, improving operational efficiency and processing time.
- Implemented JWT authentication, RBAC, and WebSocket-based concurrency control to prevent conflicting edits during simultaneous online form/claim processing — directly analogous to secure online application development.
- Planned and executed build & deployment on AWS (EC2, IAM, MongoDB Atlas, Nginx, PM2, HTTPS), including troubleshooting of test and production environments.
- Integrated Prometheus metrics, OpenTelemetry tracing, and structured Pino logging for ongoing 3rd-level support, monitoring, and error analysis on live systems.
- Built financial settlement workflows (discounts, payer contracts, TDS deductions, vendor settlements), evaluating alternative implementation approaches and supporting business/technical decision-making.
- Optimized backend performance through MongoDB indexing, connection pooling, caching, and background job processing.

PROJECTS

Horizon — Reverse Proxy & Load Balancer (TypeScript, Node.js)

03/2026 – Present

- Built a reverse proxy/load balancer with round-robin routing, active health checks, automatic failover, and a monitoring endpoint exposing throughput, latency, and backend health. github.com/rohitbytecode/Horizon

Hospital Management SaaS (TypeScript, Node.js, MongoDB)

12/2025 – 03/2026

- Built a multi-tenant SaaS backend with scalable REST APIs, retry logic, and structured error handling/logging for fault-tolerant operation. github.com/rohitbytecode/HMS-SaaS

EDUCATION

Bachelor of Computer Application (BCA) — Vivekanand College for Advanced Computer & Information Science, Surat, GJ 2023 – 2026
